

CombiPlast

▶ Case erector and bag inserter

- fully automatic
- no stops in production
- uniquely combined technologies
- compact design
- hygienic
- low film costs

Case erecting and bag inserting technology

The CombiPlast is a remarkable and unique concept with the case erecting and the bag inserting technology all housed within one very compact machine.

A perfect packaging solution for all those companies which pack products that should not dry out or should actually be protected from moisture and dust. A case erecting technology whereby the case blank is picked up from the magazine by the vacuum suction frame which holds it firmly on two panels (a short and a long). Then the bottom flaps are folded in while the case is stationary. All movements are directed towards the case, your guarantee for a perfectly erected case.

A clever vacuum system takes a bag from the magazine and the placer spreader unit positions the pre-fabricated bag neatly into the erected case

reaching all four corners. The bag is made to measure for your specific purpose, not too large and not too small.

The result; lower cost and a box with a bag, ready to be filled.
