

1 Placing bag in case

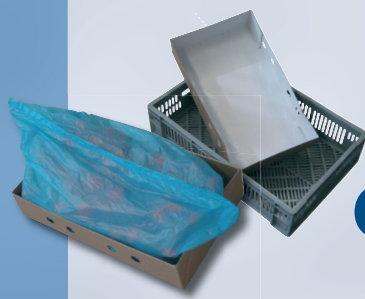

2 Bag filling

3 Bag sealing

4 Finished bag in box

CaseBagger

▶ Total solution

- fully automatic
- rotating construction
- compact

▶ Specifications

- Up to 480 bags/hour
- Max crate size:
600 x 400 x 200 mm

A fully automatic bag filling concept.

The CaseBagger is a fully automatic, compact machine. It places a bag in an empty box or crate, fills it, vacuumises and seals the bag with high speed in a wide range of boxes or crates. This is done in 4 different positions in the machine on a rotating carousel. During this whole process, the product is only in contact with the inside of the bag, complying with the strictest hygiene requirements.

The CaseBagger works as follows:

Position 1

- Imports empty box, discharges finished box (in one handling)
- Pulls the bag open
- Positions the bag into the box
- Spreads the bag to enable filling

90° rotation - Position 2

- Moves the box upwards to filling position
- Filling
- Stretches bag for sealing
- Adds additive (if required)

90° rotation - Position 3

- Option of vacuumising / gasflushing
- Seals the bag
- Removal of surplus film (waste material)

90° rotation to position 1 - Cycle renewal

- Protruding top ends of the sealed bag will be pushed back into the box (case).
